

This equipment allows to position in a suitable way and automatically the pail coming out from the lacquer application on the welded ears. This system must be installed between the connection conveyor and the curing system. Thanks to a 3-points rotating device, the pails are set in the right position in which the ears are positioned according to the heating source (hot air convection curing oven GS&T). The positioning device does not need any adjustment for pails of different height, while when changing the diameter it is necessary to operate some adjustment
